

**NATURAL WOOD FINISH**

---

The natural wood finish is not modified in any way by staining or other agents during the production process. The surface is only finished with transparent lacquer or oil, thus naturally highlighting the wood texture.

**STAINS**

---

Stains may be used to match beech or oak products to the surroundings. Staining does not affect the wood structure and most colours do not suppress the wood pattern, either. On the contrary, wood as a natural material absorbs colours differently and for this reason the surface is characterised by lighter or darker places.

The colour result is also affected by the initial range of colour of individual woody plants (see illustration photo). Stains are applied by either immersion or spraying. The surface is then finished only with transparent lacquer.

**PIGMENT FINISHES**

The natural colour and texture of wood can be covered with pigment finishes, which create a compact colour layer on the surface. The final appearance of the pigment finishes on the surface is, however, influenced by the type of wood, their different porosity and colour, production technology, light refraction and individual perception of colour finishes. E.g. on the surface of oak, which has more pronounced pores in its structure, small striations remain visible even after being finished with pigment colours.
